FlyingButtons for InDesign CS4 *is a cool script that allows you to generate a* PDF*-portfolio (like this one) in the blink of an eye.*

1) Create an empty document.

2) Place some thumbnails (frames) on the page.

3) Import an image (link) within each thumbnail. Adjust the fitting/trimming options as you need.

4) I suggest you create an Object Style — like '**tmb**' — to globally manage the thumbnail look. In addition, you may create the following specific styles: **tmb_off**, **tmb_over**, and/or **tmb_click**. The script recognizes these suffixes and will apply them to the corresponding button states. You also can use **tmb_img_off**, **tmb_img_over**, **tmb_im_click**, to separately manage internal image style. Make sure to re-apply the root style (**tmb**) to all the thumbnails before running the script.

5) Finally, create an empty frame to contain the full-size images.

6) Select the thumbnails and the empty frame, then run the script!
